

Investigating gases.

We investigated which drink was the fizziest. Fizzy drinks have carbon dioxide in the liquid to make them fizzy—you can see the bubbles of gas. We weighed our drinks making sure that we poured the same amount of liquid in each cup. We left the drinks in the same place to let them go flat. We then weighed them again using the same scales. We found that the drinks now weighed less. The drink with the most carbon dioxide had the largest difference. Most groups found that the limeade was the fizziest.
