### Science – How do polar animals keep warm?

Today we enjoyed investigating how polar animals keep warm in such cold temperatures. We learnt that some animals have fur and others have a layer of blubber. We investigated how effective blubber was at keeping us warm by testing out a glove filled with lard. We tried putting our hands in the cold water both with and without the glove and noticed it felt much warmer when wearing the glove which showed us how effective a layer of blubber is in keeping animals warm.
